Faculty of Engineering, University of Jaffna

Department of Computer Engineering

EC5080: Software Construction

Lab 07: Event-driven programming

You need to create a course registration GUI by considering the following,

1. Your first page should get the information like student name, student registration number, three course details (course code, course, credit), email, and advisor name.
2. Inputs should be validated.
3. The first page should include a submit and reset button.
4. Student name and student registration number must be entered for the submission.
5. When submitted, the next page should show them in a proper format you decide.

The application will be evaluated for the style, validation, user-friendliness.

Upload the source code as a zip file in Teams.
